

Titanic

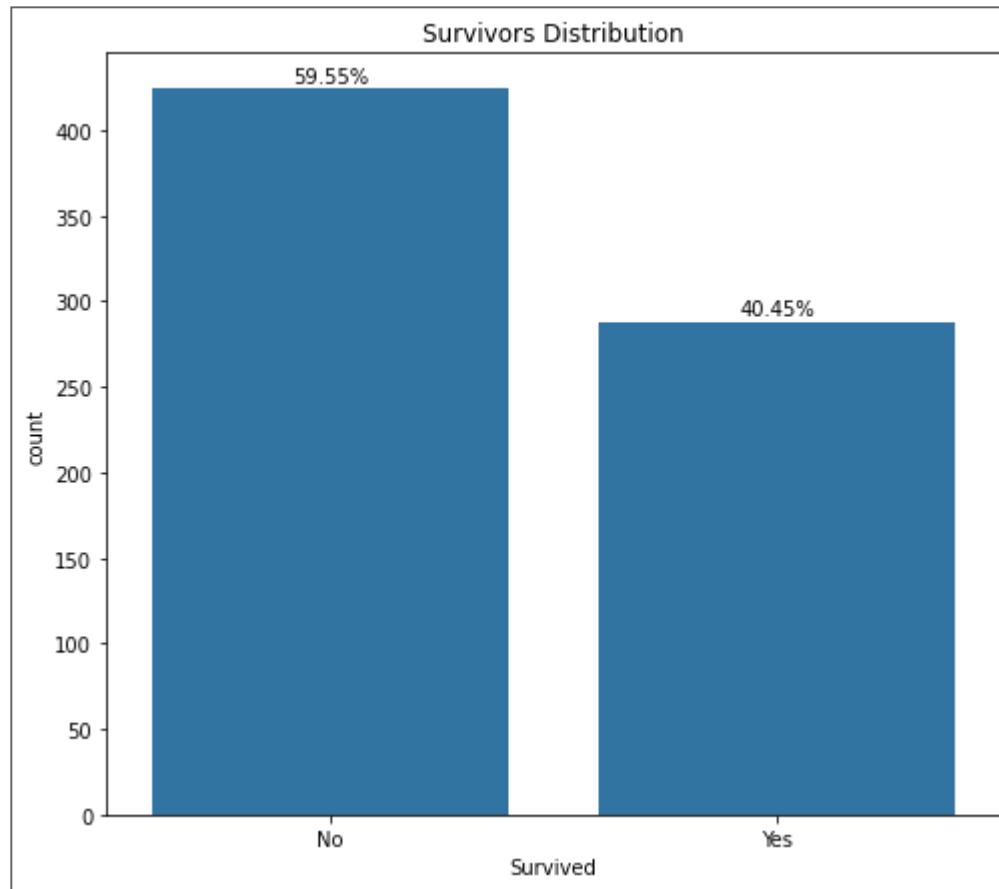

I've choose this dataset for the visualizations Project to communicate data findings. this dataset have records of the passengers who were in the Titanic backthen, it's from kaggle and it's manly for machine learning. but i find it very neat and will be good for the visualizations purpurses of this project as i manged to get intersiting qustions as listd below

Questions

- Did most people survived or not ?
- What factors affects the chance of surviving ?
- Do higher classes have higher chances of surviving ?
- Who have more chance of surviving, men or women ?
- Do solo travellers have less chances of surviving ?
- Do yenger people have more chance of surviving ?
- Do wealthier people have more chance of surviving ?

Did most people survived or not ?

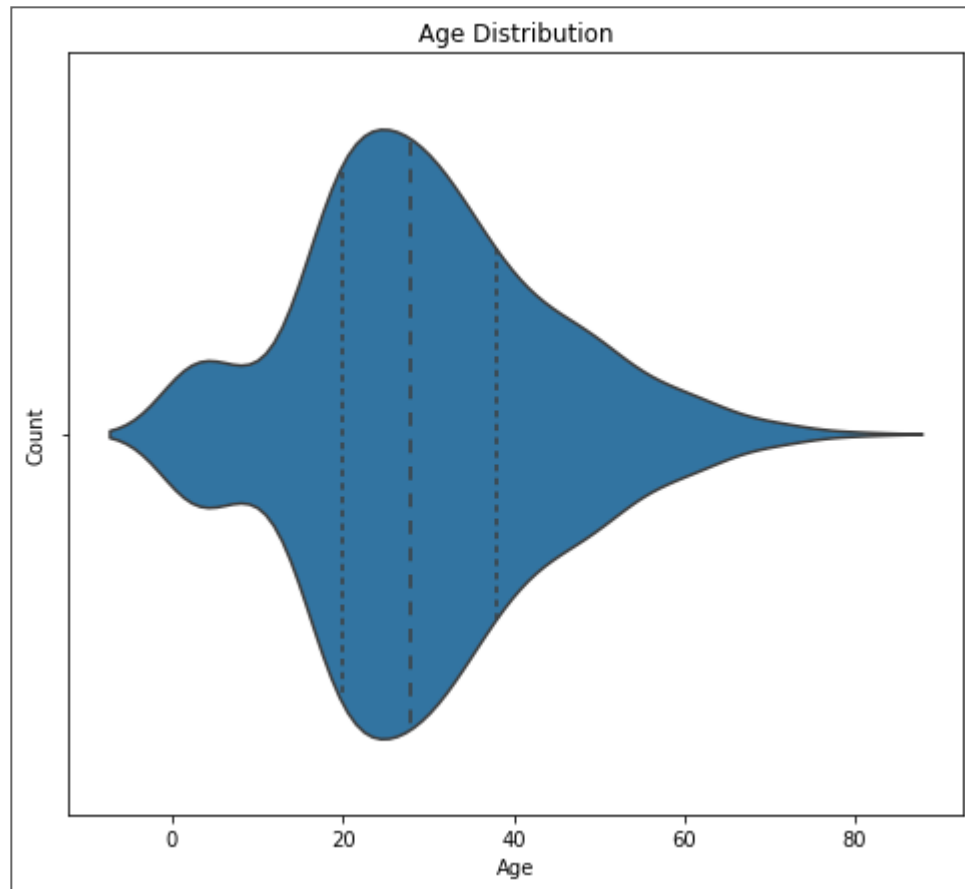

it turned out that most people didn't survived, 424 didn't and 288 did.

Age Distribution

The majority are between 20 and 40

Fare Distribution

The Fare data is skewed to the right and this is typically normal with the finance stuff. the majority are in the left (low fare)(majority of people), and small group of people with high fare to the right.

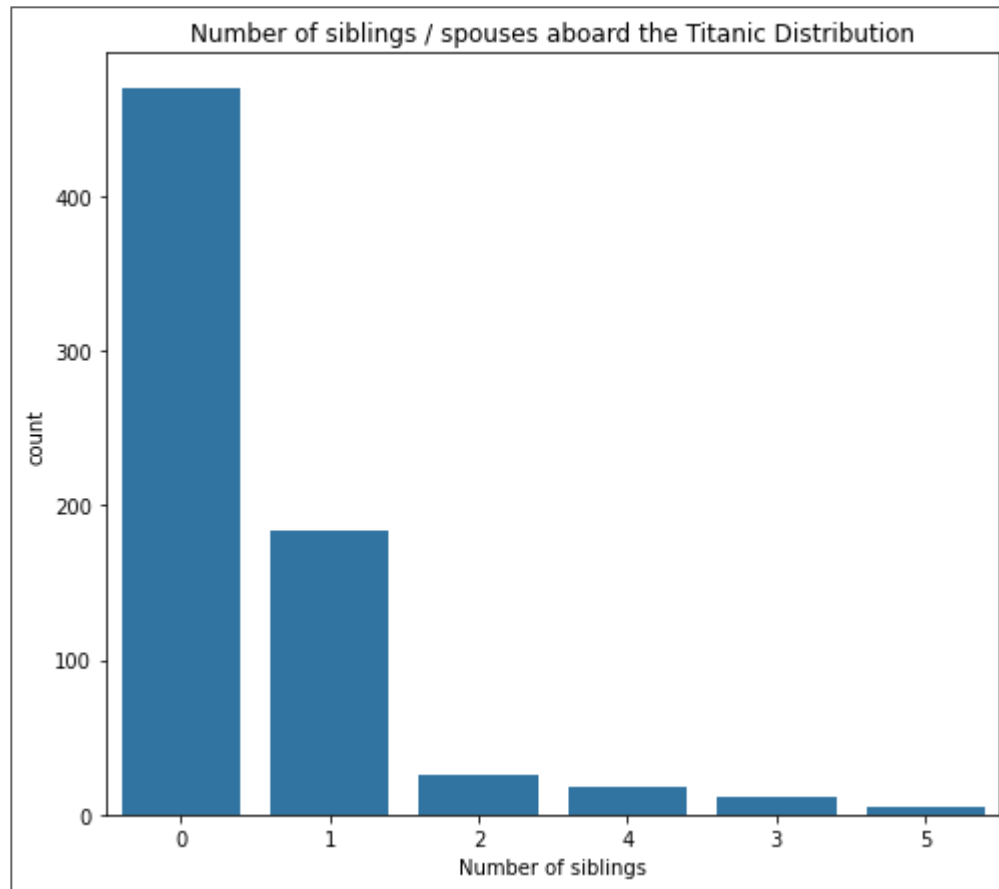

Class Distribution

Majority of people are from class 3 (expected)

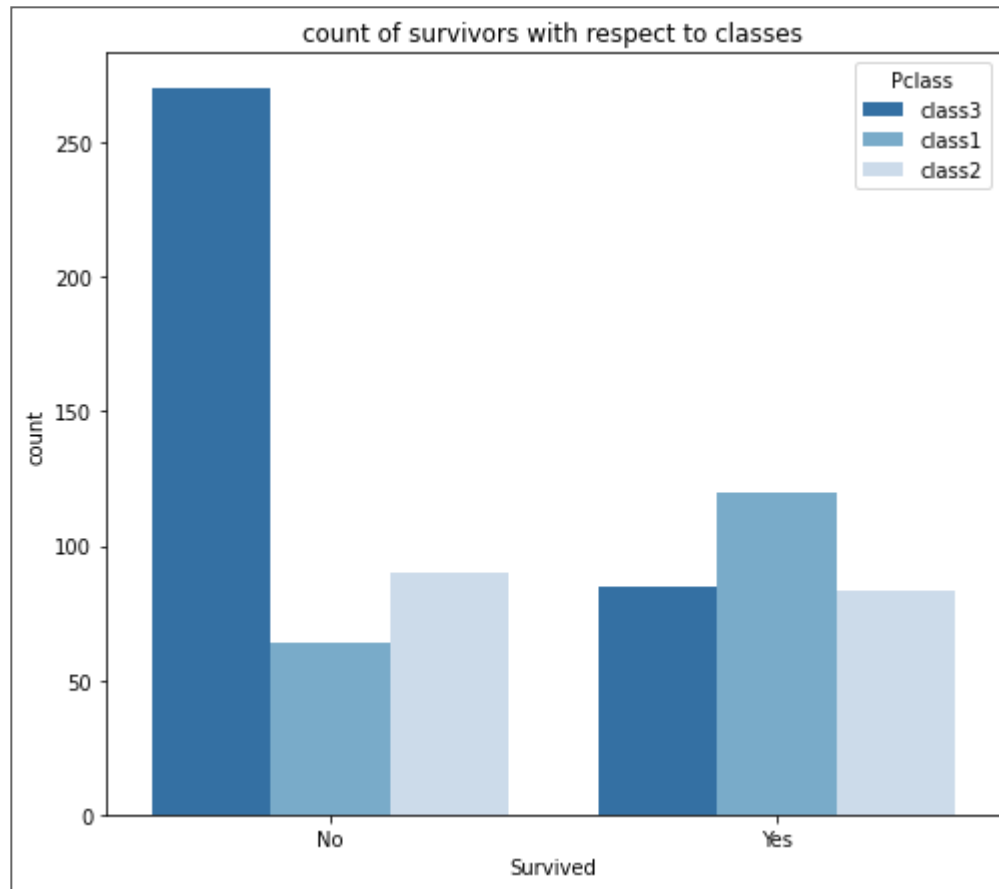

Number of siblings / spouses aboard the Titanic Distribution

majority doesn't have siblings

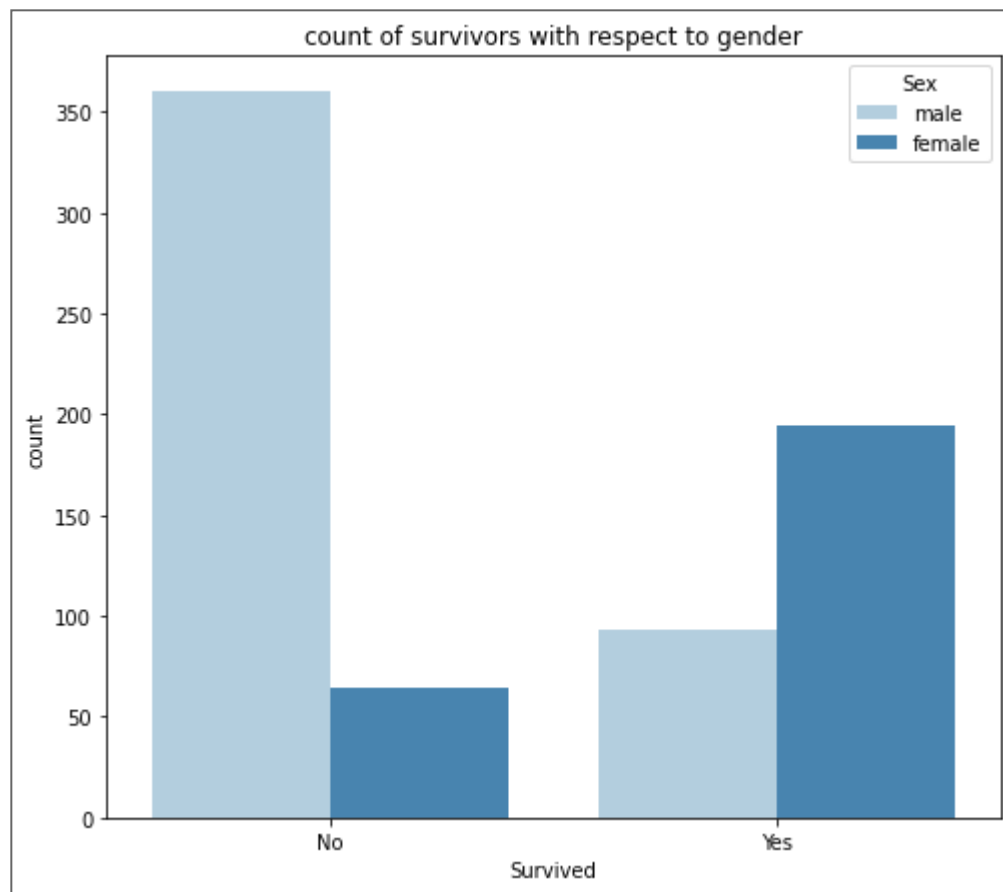

Does higher classes have higher chances of surviving ?

- we can see that the highest class class1 has the highest surviving rate, while the lowest class class3 has the lowest surviving rate
- majority of people in class3 didn't survive

Who have more chance of surviving, men or women ?

okay, this has surprised me. it seems like women have higher chance of surviving.
most men didn't make it out alive :'

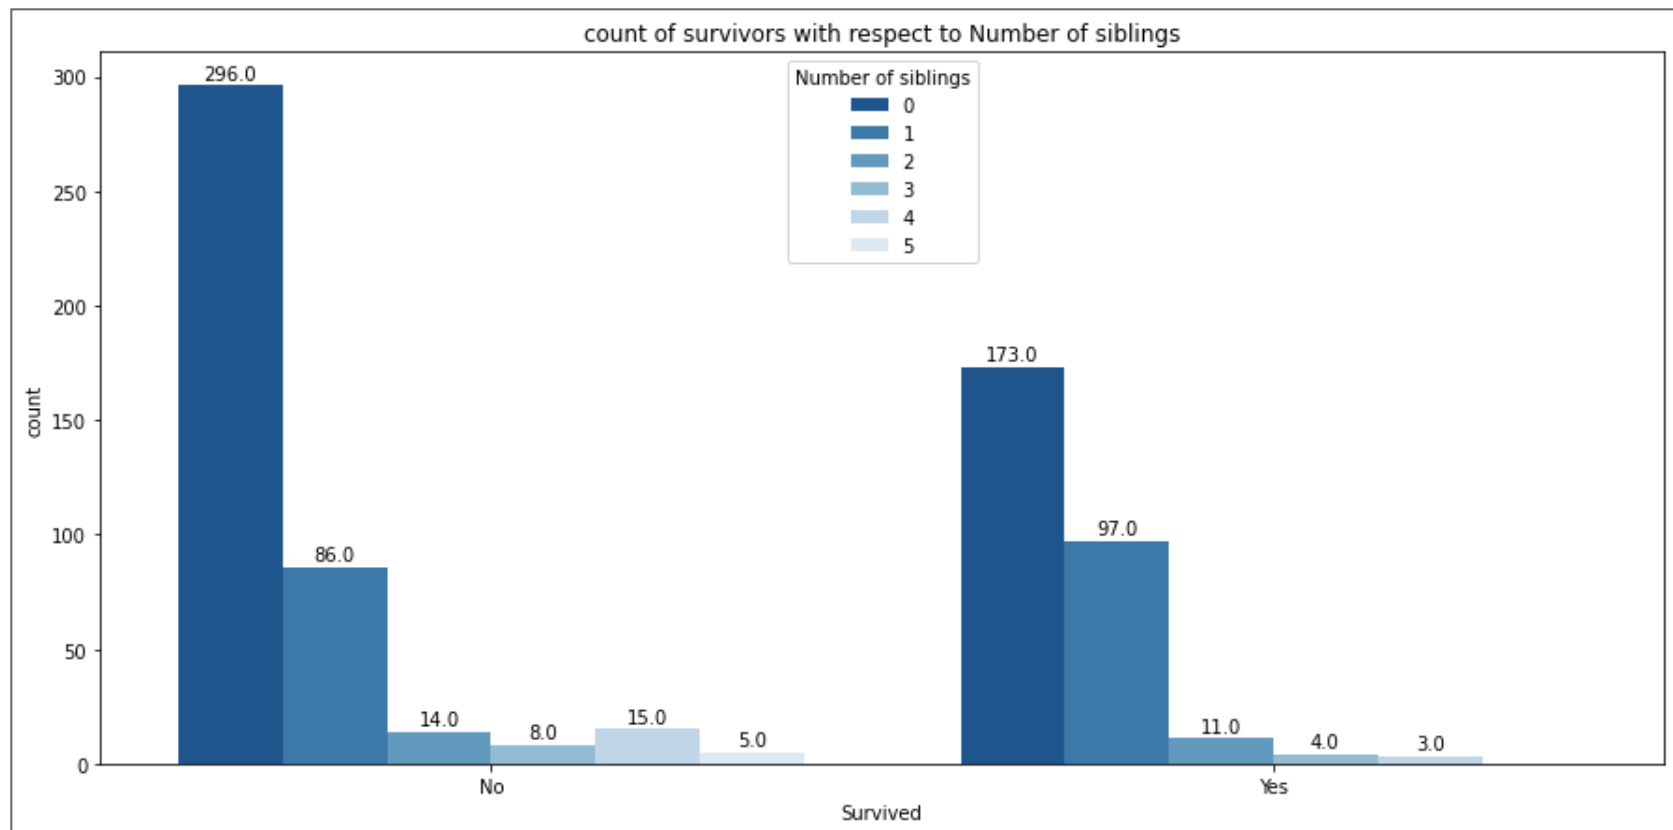

Does solo travellers have less chances of surviving ?

solo travellers have the most surviving records and not surviving too.
60% of survivors were solo travellers, 69.81% of people who didn't make it out alive were solo travellers.

but only 40.5% total survived, and 59.5% died. **so yes, solo travellers have less chances of surviving**
having family

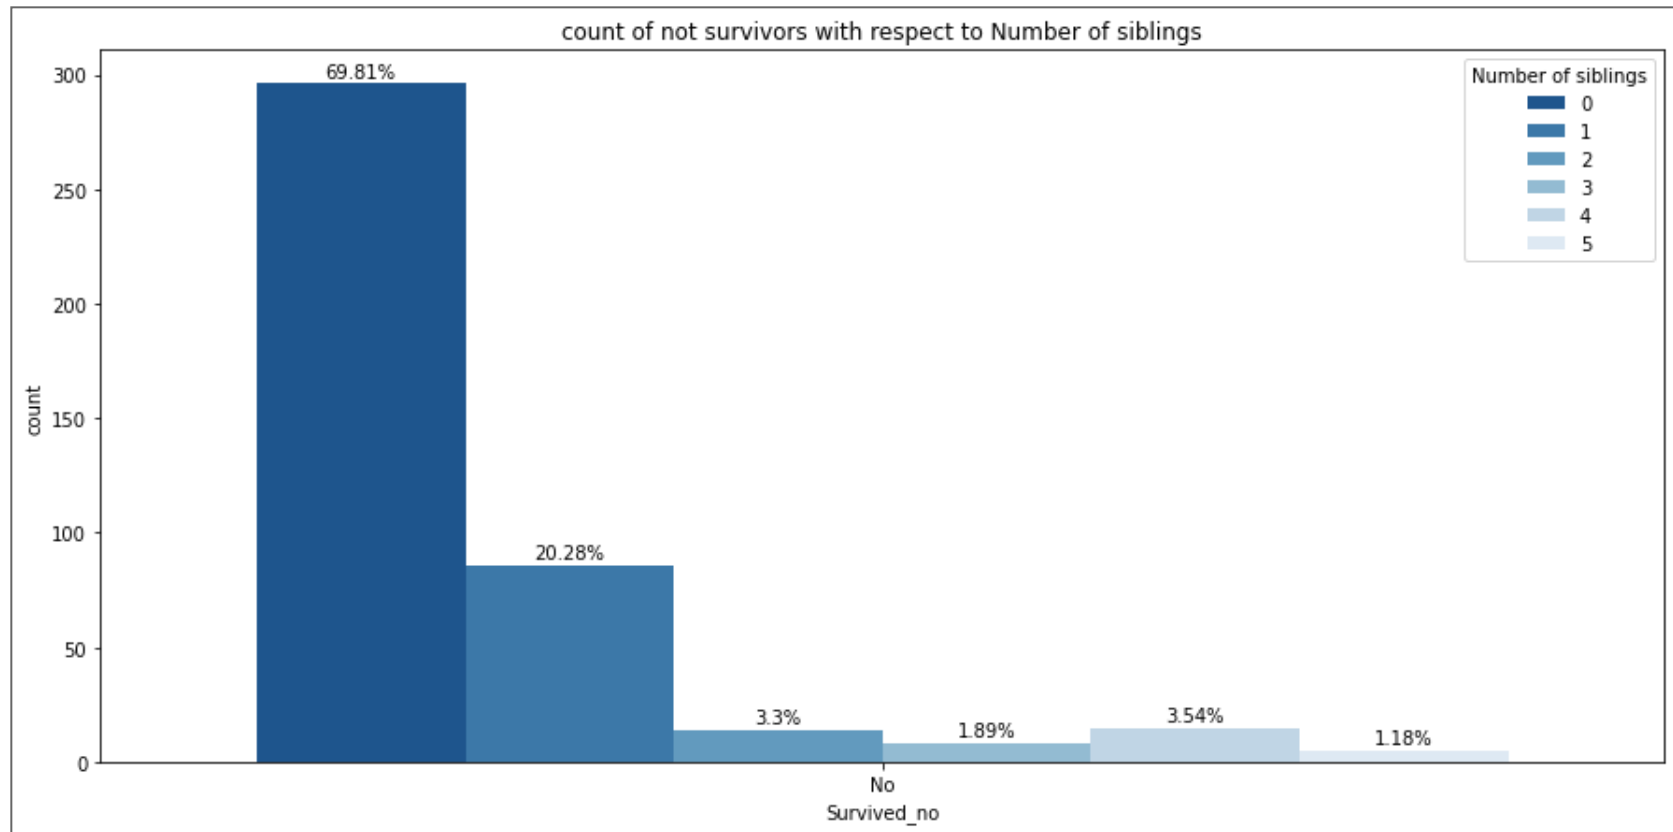

posx and posy should be finite values
posx and posy should be finite values

posx and posy should be finite values
posx and posy should be finite values

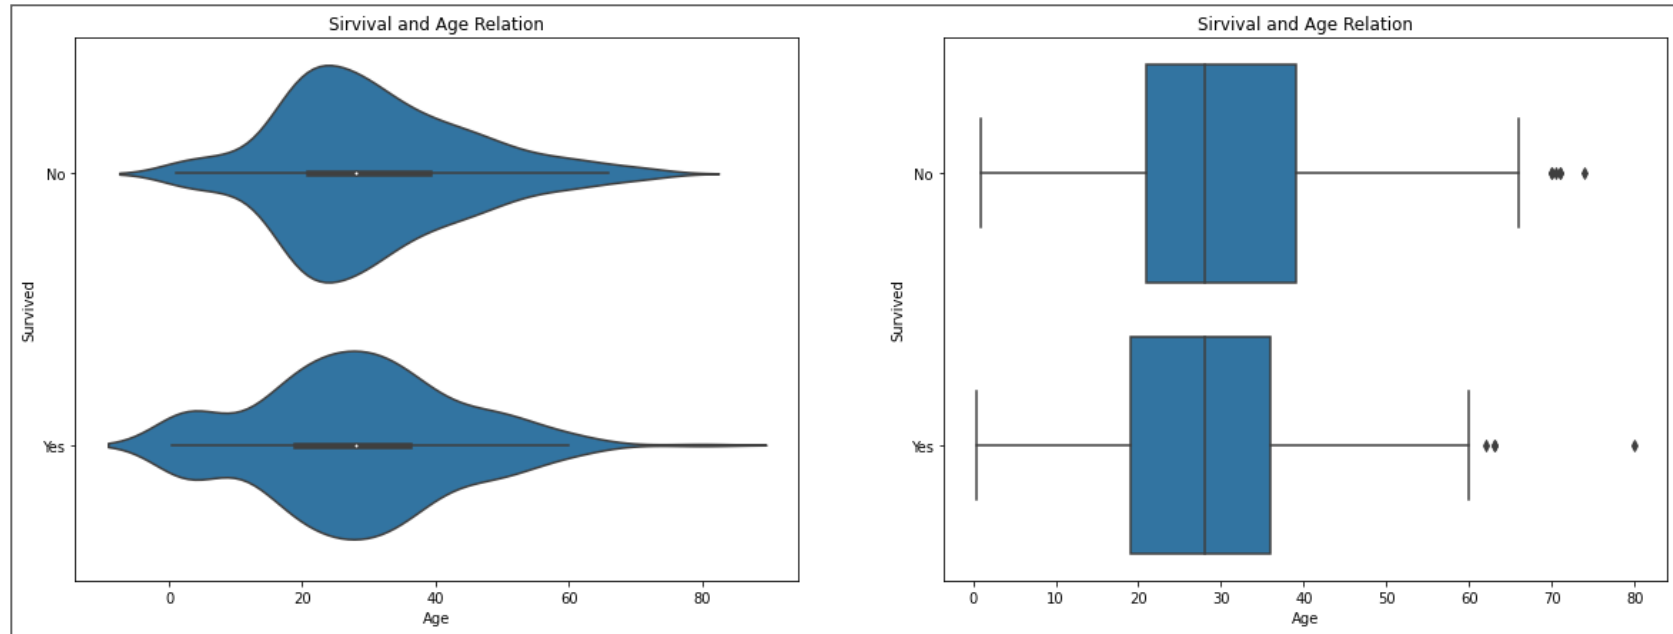

60% of survivors were solo travellers

we can see now that 60% of survivors were solo travellers, and 69.81% of people who didn't make it out alive were solo travellers

Do yenger people have more chance of surviving ?

yes

Do wealthier people have more chance of surviving ?

yes, as wealthier people are in higher classes

Yes wealthier people have more chance of surviving, as wealthier people are in higher classes

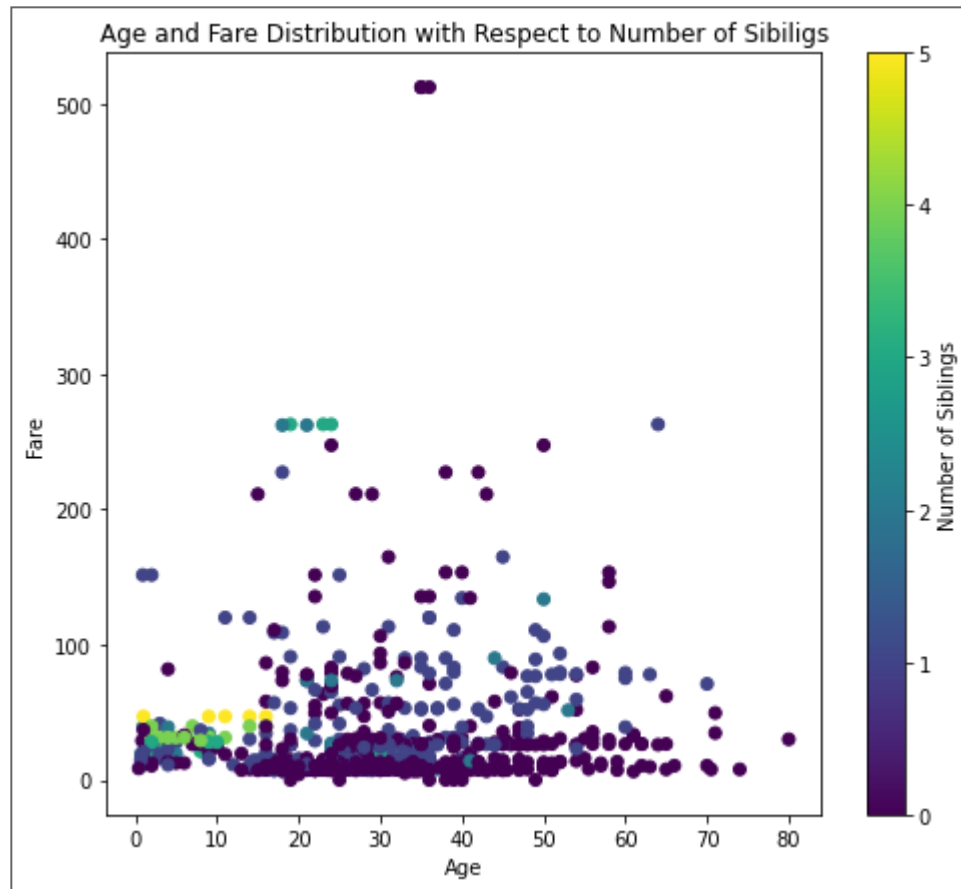

Age and Fare heat map

majority of people are with low badjet and with ages between 17 and 35

Number of Siblings with Respect to Age and Fare Distributions

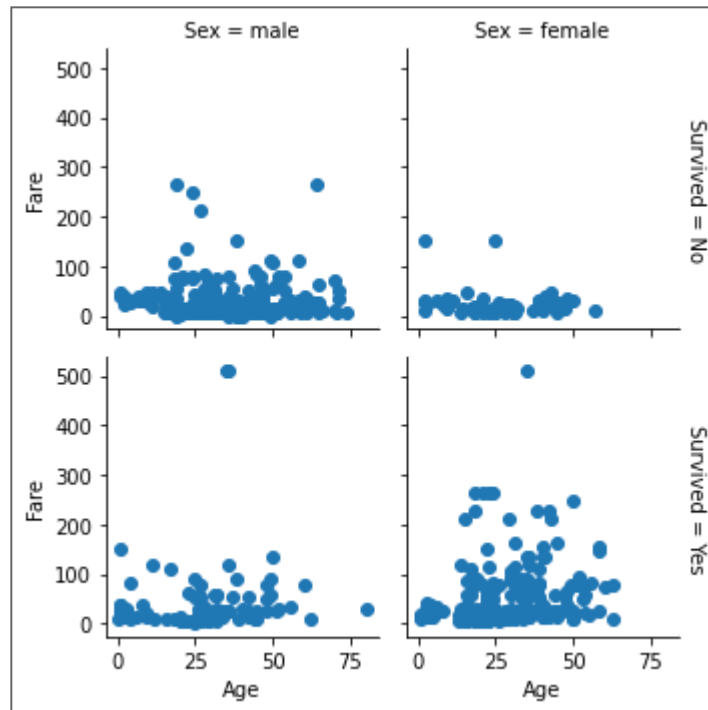

The lower the siblings number the lower the fare aproximatly

Age and Fare Distribution with respect to Gender and Survival
